

ONE PAGER – NETFLIX DATA ANALYSIS PROJECT

Petra Dudas and Flaminia Neda

Netflix Movies and TV Shows

<https://www.kaggle.com/datasets/shivamb/netflix-shows>

- The dataset contains over 8,000 Netflix titles including movies and TV shows.
- It includes information such as title, type, genre, country, release year, duration, and rating.

Data Structure

Dimensions:

- Time » Release Year
- Country
- Genre

Variables:

- Type (Movie / TV Show)
- Duration
- Rating

Research Questions

1. How has the number and type of Netflix content changed over time?
2. How does Netflix content differ across countries in terms of genre and type?
3. What problems can occur when attributes (e.g. genre or country) contain multiple values or are missing?

Potential Problems

1. Missing values
2. Non-atomic values
3. Duplicates

Data Cleaning Strategy

- Missing values » depending on the case, either ignore, remove, or substitute values
- Non-atomic values » separate values (e.g. multiple countries) into a tidy format
- Duplicates » identify and decide whether they should be removed

Planned Analysis

- Analyse how content develops over time (for example: number of movies vs TV shows)
- Comparison across countries and content types
- Genre distribution analysis using grouped summaries
- Visualization using bar charts and line plots (ggplot2)

Tools

- **R** (tidyverse, ggplot2)
- **Tidyverse** for data preparation and reshaping
- **ggplot2** for visualization

Expected Insights

- Increase in TV shows over time
- Dominance of certain countries (e.g., US)
- Popular genres such as Drama and Comedy

Limitations

- Dataset may not include all Netflix content
- Some countries or genres may be underrepresented

Key Insight

Before analysing the data, it is important to understand and clean it properly, otherwise comparisons may be misleading.
